Macro and Micro-morphological studies on roots of Plumbago indica L. and Plumbago zeylanica L

K Babu and Anoop Austin

Abstract
Citraka is an important and most popular medicinal plant extensively used in various indigenous systems of medicines. The root is used in various formulations in Ayurveda and found two varieties in the commercial market namely white flowered (Plumbago zeylanica) and red flowered (Plumbago indica). The present study was carried out to identify these species using macro and microscopical characters of the root to provide useful diagnostic tool.

Keywords: Plumbago indica, Plumbago zeylanica, Macro & Microscopic characters, Root anatomy, Identification.

Introduction
Citraka is an important medicinal plant widely used in Ayurveda, Siddha, Unini and Homeopathy and also used in folk remedies. The roots are used in many Ayurvedic preparations such as Chitrakasavam, Dasamoolarishtam, Gulgulutiktakam kashayam, Yogaraja Churnam, Kumaryasavam, Pippalyasavam etc. It is an esteemed remedy for leucoderma and other skin diseases. The root is acrid, alterative, digestive, stimulant, pungent, astringent, diuretic, germicidal, vesicant, powerful abortifacient and also an oral contraceptive. Two varieties of Citraka are recognized by physicians of Ayurveda in Kerala viz, white flowered and red flowered. White flowered variety is equated with Plumbago zeylanica, used as medicine in North India and red flowered variety equated with Plumbago indica L. (Syn: P. rosea L.) is accepted source of Citraka in Kerala and is considered to be therapeutically more active than P. zeylanica. Hence, the roots of P. zeylanica intentionally adulterated with P. indica in the commercial market. Thus, the present study was carried out to identify these species using macro and microscopic characters of the root [1-3].

Materials and Methods
The roots of both plants were collected freshly from authenticated specimens and were cut in to small pieces and fixed immediately in Formalin-Acetic-Alcohol for 24h. After fixation they were washed thoroughly in distilled water, dehydrated, embedded in paraffin wax after infiltration and sectioned using rotary microtome to the thickness of 8 to 14 μm [4]. Sections were stained with toluidine blue and observed under Nikon Eclipse 400 microscope.

Observation
Macroscopic characters of the root of Plumbago indica (Figure 1):
Root up to 0.6-0.75 meter length, tuberous, light brown colour when fresh and dark brown to blackish brown when dry. Dried roots are irregular and angular in shape, wrinkled and very brittle with characteristic strong pungent odour.

Fig 1: Plumbago indica – Habit & Dried roots
Macroscopic characters of the root of *Plumbago zeylanica* (Figure – 2):
Root length up to 0.3-0.5 meter, wiry, light yellow colour when fresh and reddish to pale brown when dry. Dried roots are uniform, cylindrical in shape, smooth surface and woody hard with characteristic very light pungent odour.

Microscopic characters of the root of *Plumbago indica* (Figure – 3):
Cork layer consist of 8-10 rows of thin-walled cells. Cortex is wide contains no phloem fibers and starch grains. Secondary xylem is ¼ diameter of the root consist large vessel elements with short radial multiples arrangements. Xylem rays are tri to tetra-seriate.

2. Cortex enlarged
3. Secondary xylem & phloem enlarged
4. Cross section of the root under polarized light
5. Longitudinal section of xylem rays

Microscopic characters of the root of *Plumbago zeylanica* (Figure – 4):
Cork layer is 6-8 rows of thick-walled cells. Cortex is narrow contains phloem fibers and starch grains. Secondary xylem is ¼ diameter of the root consist small vessel elements with long radial multiples arrangements. Xylem rays are bi to tri-seriate.

Discussion and Conclusion
The identification of crude drugs is an imperative prerequisite before using in pharmaceutical preparation. Macro and microscopic perspective of medicinal plants in an integral component of pharmacognosy, especially while proposing diagnostic protocols for establishing the botanical identity and ascertaining the quality control of raw materials [9]. Hence, the present investigation was carried out to provide useful diagnostic tool for the authentication of *Plumbago indica* and *P. zeylanica*.

The following macroscopic and microscopic features of the above drugs are the key features that can be used to diagnose these plants.
