Problems with physical and mental development, may have symptoms that include: a short

Introduction

Cereal grains are very good substrates for fermentation globally and their use as a based substrate for the development of probiotic foods is motivated by the potential health benefits they offer. Cereal grains are rich in carbohydrates, fiber, and other nutrients that can stimulate the growth of probiotics. They are also low in fat and sodium, making them a healthy choice for many people.

The choice of cereal-based substrate can vary depending on the specific benefits one wishes to achieve. For example, oats are high in soluble fiber, which can help lower cholesterol levels and improve digestion. Quinoa and amaranth are good sources of protein and iron, and can be especially beneficial for individuals with dietary restrictions or food allergies.

Fermentation of cereal grains can also enhance their nutritional value. Fermentation is a natural process that involves the breakdown of carbohydrates by microorganisms such as yeast and bacteria. This process can help improve the digestibility of cereals, making their nutrients more easily absorbed by the body. Some common fermented cereal products include lassi (a yogurt-based drink in India), buttermilk, and kheer (a sweet rice pudding).

Consumption of fermented milks has increased and various popular ingredients of functional significance are being incorporated into cultured dairy products to enhance their market value and thus with specific health benefits. Fermented milk products have been reported to have therapeutic properties like anti-cholesterolemic and anti-cancerogenic.

Abstract

Malnutrition or malnourishment is the problem which is most prevalent in today’s society and causes lots of health problems. Malnutrition is most severely found in the weaker sections of the society but can also be seen in the upper sections of the society. Under nutrition, extreme starvation might result in permanent problems with physical and mental development, may have symptoms that include: a short height, thin body, very poor energy levels, and swollen legs and abdomen. People might also suffer from diseases due to lack of immunity due to under nutrition. Cereal based functional fermented milk fulfills the nutrient requirements of an under nutrition person as it provides proper energy, protein, vitamins and minerals. Also it is seen that milk is not consumed by many due to many factors like lactose intolerance or due to dislikes, one can supplement milk by cereal based fermented milk products which will be a new nutritious product. The ingredients used in the present study “cereal based functional fermented milk product” includes whole barley flour, flax seed powder, date syrup and milk which supplements the nutrients required for an undernourished. The research included four treatments which differs in the amount of flax seed powder in which (T1) had 0.5% flax seed powder, (T2) had 1%, (T3) had 2% and (T4) had 3% flax seed powder. On the basis of the findings it is concluded that through organoleptic evaluation, cereal based milk product with composition of flax seed powder (0.5%) i.e. treatment (T1) was found to be more acceptable in terms of sensory quality followed by (T2), (T3) and (T4). But as per nutrient value, treatment (T3) was found to be more nutritious followed by (T3), (T2) and (T1).

Keywords: Malnutrition, undernutrition, extreme starvation, lactose intolerance, flax seed, date syrup, fermented milk product

Introduction

Milk and milk-derived products have constituted a significant part of the diet of all groups at all ages. Amongst those milk products, fermented milks are of great importance worldwide because of their nutritional, organoleptic and shelf-life properties that are significantly improved when compared with its raw material i.e. milk. Fermented milks are developed as a means of preserving nutrients of milk. Fermented milks including dahi, yogurts are considered as an ideal vehicle for the delivery of many beneficial microorganisms’ viz. probiotics and prebiotics in addition to the microflora of human gastrointestinal tract. Therefore, fermented milk is the most popular group of functional food.

Lactic Acid Bacteria (LAB) been widely used as starter culture for the manufacturing of various fermented dairy products such as dahi, lassi and whey beverages. LAB and their food products are thought to confer a variety of important nutritional and therapeutic benefits and have many documented health promoting or probiotic effects in humans such as inhibition of pathogenic organism, antimutagenic and reduction of blood cholesterol. Consumption of fermented milks has increased and various popular ingredients of functional significance are being incorporated into cultured dairy products to enhance their market value and thus with specific health benefits. Fermented milk products have been reported to have therapeutic properties like anti-cholesterolemic and anti-cancerogenic. Cer
Cereal based functional fermented milk fulfills the nutrient requirements of an under nutrition person as it provides proper energy, protein, vitamins and minerals. The ingredient of the cereal based functional fermented milk includes whole barley flour, flax seed, date syrup and milk which supplements the nutrients required for an undernourished. The barley supplements with protein, dietary fiber, the B vitamins, niacin and several dietary minerals like manganese and phosphorous. Also flax seed provides omega 3 fatty acid which protect against heart disease, lower triglycerides, decreased risk with higher blood levels, inflammation etc. Omega-3 fatty acids are important for normal metabolism. Mammals are unable to synthesize omega-3 fatty acids, but can obtain the shorter-chain omega-3 fatty acid ALA (18 carbons and 3 double bonds) through diet and use it to form the more important long-chain omega-3 fatty acids. It is known that animal food is a good source of omega 3 fatty acids but vegetarian diet lacks.

Material and Methods
The experiment was carried out in the research laboratory of the department of Dairy Technology, Warner College of Dairy Technology, Sam Higginbottom University of Agriculture, Technology and Sciences, Allahabad. Milk, Skim milk, Flaxseed powder, Whole Barley Flour, Date Syrup were obtained from the local market of Allahabad. Cultures were procured from Student’s Training Dairy SHUATS, Allahabad. The experimental product was prepared by using toned milk with fat-3.0% and SNF-8.5%. The milk was homogenised and heated to 90°C for 2 min. then the milk was cooled at 30-32°C. After cooling, 5% of skim milk powder was added while continuous stirring to increase the SNF to 11%. Barley flour with 4% was then mixed with the milk. After this addition of flax seed powder was done in variation with T₁ having 0.5%, T₂ having 1%, T₃ having 2% and T₄ having 3%. 10% Date syrup is mixed with the ingredients and is properly mixed with an electrical mixer. Finally 2% bacterial culture was added and the mix was then packed in air tight containers/ polystyrene cups which were capped and incubated at 37°C for 8 hours. The fermented milk product prepared was cooled and stored in refrigerator under 5°C.

The treatment combination used is as follows
T₁- Toned milk- 100ml, Skim milk powder- 5%, Whole barley flour-4%, Date syrup- 10%, Flaxseed powder- 0.5%.
T₂- Toned milk- 100ml, Skim milk powder- 5%, Whole barley flour-4%, Date syrup- 10%, Flaxseed powder-1%.
T₃- Toned milk- 100ml, Skim milk powder- 5%, Whole barley flour-4%, Date syrup- 10%, Flaxseed powder-2%.
T₄- Toned milk- 100ml, Skim milk powder- 5%, Whole barley flour-4%, Date syrup- 10%, Flaxseed powder-3%.

The present study was undertaken for manufacturing of cereal based functional fermented milk product. The present investigation was carried out to see the possibility of incorporating barley flour, flax seed powder, and date syrup into the indigenous milk product dahi and the results obtained from the analysis were subjected to sensory characteristics of cereal based fermented milk product.

Result and Discussions
The average of data obtained on organoleptic analysis in four replication and cereal based fermented milk product.

Colour and Appearance
The highest average for colour and appearance (8.00) was recorded in T₁ sample containing 0.5% of flaxseed flour, followed by T₂ (7.80), T₃ (7.77), T₄ (7.40).

Texture and Consistency
The highest texture & consistency (8.55) was recorded in T₁ sample containing 0.5% of flaxseed flour, followed by T₂ (8.31), T₃ (8.26), T₄ (8.04).

Taste and Flavour
The highest average for taste & flavour (8.65) was recorded in T₁ sample containing 0.5% of flaxseed flour, followed by T₂ (8.22), T₃ (7.72), T₄ (7.50).
**Overall Acceptability**

The highest average for overall acceptability (8.39) was recorded in T₁ sample containing 0.5% of flaxseed flour, followed by T₂ (8.11), T₃ (7.91), T₄ (7.63).

**Conclusion**

On the basis of the results obtained during the study it is concluded that flax seed flour and barley flour along with date syrup can be successfully employed for the preparation of cereal based milk product. The data obtained on various parameters were statistically analysed. Organoleptic evaluation showed that cereal based milk product by using flax seed flour (0.5%) that is treatment (T₁) was found to be more acceptable in terms of sensory quality followed by (T₂), (T₃) and (T₄). But as per nutrient value treatment (T₄) was found to be more nutritious followed by (T₃), (T₂) and (T₁).
