Medicinal use of *Centaurea cyanus* Linn. To cure ophthalmia

Amit Tomar

Abstract
In this paper highlights a brief description of *Centaurea cyanus* L. belongs to Asteraceae family is provided along with its medicinal use to cure Ophthalmia.

Keywords: *Centaurea cyanus*, Medicinal use, Ophthalmia

Introduction
The Indian system of Ayurvedic medicines has played an important role in our country in providing medical care since antiquity. This system of medicine is as old as our history and has formed an integral part of the Indian tradition since time immemorial.

During survey on the medicinal plants of Uttar Pradesh, the author came across common ornamental population of *Centaurea cyanus* at Hastinapur, Meerut district. Uttar Pradesh is divided into two geographical regions, which are Southern hills and Plateau and Ganga Plain. The Western Uttar Pradesh situated in the Northern part of India and it includes seven regions (Meerut, Saharanpur, Moradabad, Aligarh, Bareilly and Agra). During the major part of the year climate of W.U.P. is influenced largely by the prevalence of dry air of the continental type, the summer being intensely hot and winter cold.

Uttar Pradesh has a very ancient and colorful history. The region finds mention in the great epics, the *Ramayana* and *Mahabharata*. Uttar Pradesh lies between 23°52' and 29°45' North Latitudes, to 77°04' and 84°38' East Longitudes. The Uttar Pradesh region covers a surface area of 240,928sq km and ranks fifth in terms of area and the most populous state of the India. Uttar Pradesh comprises 75 districts. Uttar Pradesh is one of the border states of India and is bounded in the north by Uttaranchal, in the north-west by Haryana, in the south-west by Rajasthan, in the south by Madhya Pradesh and Chhattisgarh, in the south-east by Jharkhand and in the east by Bihar.

In this region, soil mostly loamy and in some area it is sandy loam, silty loam and clay loam occasionally meet within the area. The rainfall varies considerably from year to year. The maximum rainfall recorded during the monsoon in the month of July-September. Climatically the year may be divided into four seasons. The cold season from near the end of November to the beginning of March, followed by hot season, which continues till about the end of June, when the south-west monsoon arrives, the monsoon season lasting till September end and the next two months forming the transitional period. The air is dry for the most part of the year. In April and May, these are usually the driest months.

Materials and Methods
The present paper is based on the survey and collection of the data from the native informants, who are Vaidhya or Hakim (Ayurvedic medicine practitioners) and rural people who have knowledge about Ayurvedic medicine with their local name. Oral interviews were held in villages and information recorded at the spot.

Medicinal plants were collected and preserved for the future use. The plants were pressed in old newspapers and blotting sheets for dehydration in strong ply board. The Species were changed to fresh sheets after an interval of 24 hours to 2-3 days depending on the weather conditions until the specimens were completely dry. The plant species were identified with the help of available floras. Doubtful medicinal plants are confirmed at the herbaria of Forest Research Institute (F.R.I.) and Botanical Survey of India (B.S.I.) Dehradun.

Species is commonly found in all places of cultivated field areas in Uttar Pradesh. It is cultivated in gardens and parks as a ornamental annual herb. There is no method to preparation of medicinal use for treating their disease reported by earlier researchers. Perusal of literatures on medicinal plants.
Method to preparation of Medicine
Cold infusion is prepared with dried flowers (2-3 tsp) with two cups of normal water. This solution is kept for twelve hours overnight and strained the next morning.

Medicinal use
It is applied to cure ophthalmia and eye wash.
Dose: The solution is applied once a day.

Description of Species
Centaurea cyanus It is an annual plant growing to 16-35 inches tall, with grey-green branched stems. The leaves are lanceolate, 1-4 cm long. The flowers are most commonly an intense blue colour, produced in flowerheads (capitula) 1.5–3 cm diameter, with a ring of a few large, spreading ray florets surrounding a central cluster of disc florets.

Chemical composition: The flowers contain centaurocyanin and flavonoids.

Results and discussion
The species has been identified as Centaurea cyanus. The species occurs as an annual herb. It is cultivated in gardens and park as an ornamental plant. Therefore, study was conducted and revealed that Centaurea cyanus is used as Ayurvedic medicines in some part of Uttar Pradesh.

Acknowledgement
Author is thankful to his respected teachers Prof. (Dr.) Y. Vimala, Department of Botany, C. C. S. University, Meerut and Late Dr. H. Singh, Department of Botany, Meerut College, Meerut (U.P.) for their sincere guidance.
