Qualitative and quantitative phytochemical analysis of *Costus igneus* leaf extract

Dr. C Muthukumar, Dr. L Cathrine and S Gurupriya

**Abstract**

*Costus igneus*, is a medicinal plant and capable of having magic cure for diabetes. leaf of this herbal plant helps to build up insulin by strengthening β–cells of pancreas in the human body thus popularly known as “insulin plant” in India. In the present study qualitative analysis, leaf extract of *Costus igneus* were analysed for the presence of alkaloids, carbohydrates, saponin, protein, phytosterol, phenolic compounds, flavonoids and glycosides were screened in methanolic solvent extracts. Methanolic extract of the leaf showed maximum amount phytochemicals was screened in *Costus igneus* Quantitative estimation of *Costus igneus* showed the presence alkaloids, saponins, phenols and flavonoids determined by using standard methods. From the results, it is evident that the plant *Costus igneus* leaves are found to have maximum amount of phytocomponents.

**Keywords:** Phytochemical constituents, *Costus igneus*, qualitative and quantitative analysis

1. **Introduction**

Phytochemicals are naturally occurring in the medicinal plants, leaves, vegetables and roots that have define mechanism and protect from various diseases. Phytochemical studies have gained a lot of interest among the plant scientists due to the development of newer technology and sophisticated outcome. These techniques play a significant role in finding of important material for pharmaceutical industry. Plants have substances that induce a great interest due to their versatile applications. It is estimated that 14-18% of higher plant are used medicinally and related to 74% of pharmacologically active plant are discovered after following up on ethnomedicinal usage of the plant. The plant *Costus igneus* belongs to the family Costaceae, which is found in tropical Africa, Asia, Australia, and North, Central and South America. In India, it is cultivated in coastal area, Uttar Kannada district of Karnataka. In this area, people take traditionally 2-3 leaves of this plant twice a day for the management of diabetes. It is a prostrate growing plant with spreading, rooting stems. Its leaves are slender and lance shaped with tooted, scalloped or lobed margins. They are grayish green stained with red purple above and darker purple beneath. The tiny white flowers grow intermittently throughout the year. This plant reaches a height of 6-inches and have an indefinite spread. Considering the medicinal importance of these widely available plant species, the aim of the present study was to identify the Qualitative and Quantitative phytochemical analysis of *Costus igneus*.

2. **Materials and Methods**

2.1 **Collection of plant material**

Fresh *Costus igneus* leaves used in this experiment were collected in the surrounding areas of Lalgudi, Trichy.

2.2 **Extraction of plant material**

Healthy plant leaf *Costus igneus* were collected, washed thoroughly in tap water and dried in room temperature for 30 days. The dried leaves were powdered and 25 g leaf powder soaked in 225 ml of Methanol for 3 days. The extracts were filtered through whatmann No.1 filter paper. Similar process was repeated twice with fresh solvent and the filtrate was collected together. Similar procedures were followed for other solvents like Dichloromethane, Petroleum ether, hexane and benzene. The extract was stored at the refrigerator for further studies.

2.3 **Qualitative analysis of primary and secondary metabolites from *Costus igneus***

The leaf extracts from *Costus igneus* were analyzed for the presence of alkaloids, carbohydrates, reducing sugar, saponin, protein, phenolic compounds, tannin and
glycoside according to the common phytochemical methods
described by Harborne (1998).

2.4 Quantitative estimation of secondary metabolites from
Costus igneus

2.4.1 Determination of Alkaloid by the method of
Harborne (1973) \[8\]

5 gs of the \textit{Costus igneus} leaves powdered was weighed into a
250 ml beaker and 200 ml of 10% acetic acid in ethanol was
added and covered and allowed to stand for 4 h. This
was filtered and the extract was concentrated on a water bath to
one-quarter of the original volume. Concentrated ammonium
hydroxide was added drop wise to the extract until the
precipitation was complete. The whole solutions were allowed
to settle and the precipitated were collected and washed with
dilute ammonium hydroxide and then filtered. The residue is
the alkaloid, which was dried and weighed.

2.4.2 Determination of Saponin by the method of
Obadoni and Ochuko (2001) \[9\]

5 gs of \textit{Costus igneus} leaves powder were put into a conical
flask and 100 ml of 20% aqueous ethanol were added. The
samples were heated over a hot water bath for 4 hs with
continuous stirring at about 55 $^\circ$C. The mixture was filtered
and the residue re-extracted with another 200 ml of 20%
ethanol. The combined extracts were reduced to 40 ml over
water bath at about 90 $^\circ$C. The concentrate was transferred
into a 250 ml separation funnel and 20 ml of diethyl ether was
added and shaken vigorously. The aqueous layer was recovered
while the ether layer was discarded. The purification process was repeated. 60 ml of n-butanol was added. The combined n-butanol extracts were washed twice
with 10 ml of 5% aqueous sodium chloride. The remaining
solution was heated in a water bath. After evaporation the
samples were dried in the oven to a constant

2.4.3 Determination of total phenols by
spectrophotometric method of Kim et al., (2003) \[10\]

A diluted \textit{Costus igneus} leaves extract (1 ml) or Gallic acid
standard phenolic compound was added to a 25 ml volumetric
flask, containing 9 ml of distilled water. 1 ml of Folin-
Ciocalteu’s phenol reagent was added to the mixture and
shaken. After 5 min, 10 ml of 7% \textit{Na}_{2}CO_{3} solution was mixed in
to the test sample solution was diluted to 25 ml distilled
water and mixed thoroughly. The mixture was kept in the
dark for 90 min at 23 $^\circ$C, after which the absorbance was read
at 750 nm. Total phenol content was determined from
extrapolation of calibration curve which was made by
preparing Gallic acid solution. The estimation of the phenolic
compounds was carried out in triplicate. The Total Phenolic
content was expressed as milligrams of Gallic acid (GAE)
equivalents per gram dried sample.

2.4.4 Determination of total Flavonoids by the method of
Katashani (2001) \[11\]

\textit{Costus igneus} leaves extract (0.5 ml) were mixed with 1.5 ml
of methanol, 0.1 ml of 10% aluminum chloride, 0.1 ml of 1M
potassium acetate and 2.8 ml of distilled water. It remained at
room temperature for 30 minutes. The absorbance of the
reaction mixture was measured at 510 nm using UV-Visible
spectrophotometer. The calibration curve was prepared by
preparing quercetin solutions to concentrations 20 to 80 $\mu$g/
ml in methanol. The Total flavonoids content was expressed
as milligrams of quercetin equivalents per gram of dried sample.

3. Results and Discussion

3.1 Qualitative Phytochemical analysis of \textit{Costus igneus}
from leaf extract

The phytochemical screening of \textit{Costus igneus} leaf extracts
was done with Methanol, Dichloromethane, Petroleum ether,
hexane and benzene The qualitative analysis of bioactive
compounds for five extracts shown in (Table-1). Methanolic
extract was found to have a wide range of bioactive
compounds like alkaloids, carbohydrates, reducing sugar,
protein, saponin, glycoside, flavonoids. Benzene extract was
found to have a wide range of bioactive compounds like
carbohydrates, saponin, glycoside and protein. Hexane being
non-polar in nature was able to extract very less amount of
bioactive compounds characterized like alkaloids,
carbohydrates, tannin, glycoside and Phenolic compounds.
The chloroform extract was positive for carbohydrate,
Protein, reducing sugar, glycoside and Phenolic compounds.
The Dichloromethane was found to have alkaloids,
carbohydrate, reducing sugar and flavonoids.

Among the five different extracts, Methanolic extract of the
leaves showed maximum amount phytochemicals was
screened in \textit{Costus igneus}. The presence of bioactive
constituents indicates that the \textit{Costus igneus} can be used in a
multitude of ways for the beneficiary of population.

3.2 Quantitative Determination of secondary metabolites
from \textit{Costus igneus}

The amount of alkaloids, saponin, Total phenols and Total
flavonoids was determined by using standard methods (Table-
2) Gallic acid was used as a standard compound and the total
phenols were expressed as mg/g gallic acid equivalent using
the standard curve equation: $y = 0.016x + 0.255$ $R^2 = 0.997$
(Figure: 1) where $y$ is absorbance at 750 nm and $x$ is total
phenolic content in the extracts of \textit{Costus igneus} expressed in
mg/gm. The total phenolic content was 25.3±0.0027 mg/gm
in the extracts, showed in (Table-2). The amount of total
flavonoids was determined with aluminum chloride reagent.
The calibration curve for quercetin is shown in (Figure: 2).
Quercetin was used as a standard compound and the total
flavonoid was expressed as mg/g quercetin equivalent using
the standard curve equation: $y = 0.016x + 0.255$ $R^2 = 0.997$
(Figure: 2). Where $y$ is absorbance at 510 nm and $x$ is total
flavonoid content in the extracts of \textit{Costus igneus} expressed in
58.3±0.2837mg/gm. The total flavonoid content was mg/g
in the extracts, respectively (Table- 2). Alkaloids were determined by the method of Harborne
(1973). The alkaloid content was 14.5±0.1124 mg/g in the
extracts. Saponin was determined by the method of Obadoni
and Ochuko (2001). The saponin content was 61.1±0.0823mg/g in the extracts. The phytochemical analyses
of the medicinal plants is important and have commercial
interest in both research institutes and pharmaceuticals
companies for the manufacturing of the new drugs for the
treatment of various diseases. Thus, we hope that the
important phytochemical properties identified in the present
study of \textit{Costus igneus} leaves will be helpful in the treatment
of various ailments.

4. Conclusion
The medicinal value of these plants lies in some chemical substances that produce a definite physiological action on the human body. Different phytochemicals have been found to possess a wide range of activities, which may help in protection against chronic diseases. The qualitative analysis of the five different leaf extract of *Costus igneus* reveals the presence of medicinally valued bio active components like, flavonoids, tannins, alkaloids, saponin, reducing sugar, phenolic compounds and glycosides. Quantitative estimation *Costus igneus* leaf contained higher content of saponins and total flavonoids, with lesser amount of phenols and alkaloids. *Costus igneus* are used for discovering and screening of the phytochemical constituents which are very helpful for the manufacturing of new drugs for treatment of various diseases. The research is in progress to discover its biological activity and enhance the pharmacological profile of it in the area of traditional medicine.
